

Field Availability Estimates 101: Projecting Potential Applicant Pools

For 2024 IHP Proposal Process

UO Values

The University of Oregon is dedicated to increasing diversity, equity, and inclusion. To achieve this in our hiring, each year we update our strategy to reflect the evolving best practices of active recruitment, with the goal of building strong, diverse applicant pools. We enhance these efforts by crafting searches in ways that foster high-quality, diverse pools; Field Availability Estimate analysis is one tool to help units consider how the focus of their searches might impact the demographics of future applicant pools.

What are Field Availability Estimates?

Field Availability Estimates provide a demographic breakdown of recent domestic (US) terminal degree awards by field and subfield. In other words, they offer a demographic snapshot of people who have earned terminal degrees in these fields and may therefore be potential applicants. These data are from two sources:

- **SED:** National Science Foundation (NSF) Survey of Earned Doctorates (SED) – an annual census of research doctoral degree recipients from accredited U.S. academic institutions. <https://ncses.nsf.gov/surveys/earned-doctorates/2022>
- **IPEDS:** U.S. Department of Education's National Center for Education Statistics (NCES), Integrated Postsecondary Education Data System (IPEDS) – annually reported degree conferrals from higher education institutions. <https://nces.ed.gov/ipeds/>

UO uses both SED and IPEDS data to offer a fuller picture for Field Availability Estimates; the data reflect terminal degree recipients by field over a multi-year period (IPEDS:2017-2021 & SED:2021-2022)ⁱ. The “Source” column in the table indicates the data source for each field.

Using Field Availability Estimates

In this oversimplified example, a unit is deciding whether to search in a *Discipline-Specific Field* or to refine down to a *Discipline-Specific Field Subset* (e.g. a more qualitative subfield). As is shown by the example FAE data below, restricting the scope of their search to this *Discipline-Specific Field Subset* could reduce the likelihood of attracting female applicants by almost half. In the *Discipline-Specific Field*, a search pool might expect female representation around 65%; that drops to 35% if they focus their search to this *Discipline-Specific Field Subset*. In this way, Field Availability Estimates give the unit an opportunity to consider possible search field(s) with respect to potential unintended consequences on the applicant pool.

Degree Field/Subfield	Estimated % Women in Field	Estimated % Underrepresented Minorities in Field						Source
		% Total Minorities	% Black or African American	% Asian	% American Indian or Alaska Native	% Hispanic or Latino	% Two or more races	
Discipline-Specific Field	65%	40%	10%	20%	1%	5%	4%	SED
Discipline-Specific Field Subset	35%	40%	10%	20%	1%	5%	4%	SED

Why do Field Availability Estimates matter?

When choosing a search focus, Field Availability Estimates can help highlight the potential impacts of a search direction on the potential candidate pool – see the Example above. Looking at the Field Availability Estimates helps units see when decisions are more likely to eliminate high-quality underrepresented candidates.

When conducting a search, Field Availability Estimates can be used as units craft position descriptions, design advertising, and engage in active recruitment efforts (e.g., identifying when focused outreach is necessary to attract a robust pool). They can also be used as a reference point from which units can gauge their applicant pools at appropriate search milestones.

What about my other insights into the field?

It is important to recognize that Field Availability Estimates are only one aspect of anticipating and developing strong candidate pools. In 2024 IHP proposals, units may also reference additional data sources within their disciplines (e.g., data on international applicant pools, data on postdocs) and what they already know about availability in the field (e.g., insights on graduates who seek positions in academia vs industry), as long as they include that data with their proposal. This discipline-specific information is welcome, as it provides additional insight into likely applicant pools.

Where can I learn more?

- For information on 2024-25 Institutional Hiring Plan: <https://provost.uoregon.edu/ay2024-25-institutional-hiring-plan>
- For information on Active Recruitment: <https://provost.uoregon.edu/active-recruitment-tenure-track-faculty-searches>

¹ The National Center for Science and Engineering Statistics (NCSES) revised the field hierarchy in 2021, making comparisons to prior years' data impossible in many situations. These FAE documents will use SED data beginning with 2021 until there are five years of data, after which point only the most recent five years of data will be used.

Sources:

IPEDS is the U.S. Department of Education's, National Center for Education Statistics (NCES), Integrated Postsecondary Education Data System (IPEDS). It contains annually reported degree conferrals from higher education institutions.

SED is the National Science Foundation (NSF) Survey of Earned Doctorates (SED). It is an annual census of research doctoral degree recipients from accredited U.S. academic
